## TSM

### Provide Integrated Automation Services

**T**AIWAN SPREADING CENTER was established in 1988. The company's core businesses are mainly production of cutting equipment in garment factories. They focus on the world market scope, so TSM provides integrated automation and intelligent services, and has become a changer who leads the market.

The TC-7000 automatic cutting machine is a device that replaces traditional manpower. The operation is simple and solves the problem of passing down experience and expertise to the work force. Because the thickness and hardness of the fabrics are constantly changing, the force applied to the blade is also increased, which often leads to damage of tools. These damages result in increase in product defect rate. With the help of this new technology, the LFC system cuts and detects the force applied to the blade in real time, and automatically adjusts the cutting angle to reduce the pressure load on the blade to help ensure that the cutting angle of the blade is straight. And the product size is the same from top to bottom.
