Get Your Inventory Under Control by Yourself

Get Your Inventory Under Control by Yourself

- Your storage space is absolutely unique to you, and each piece of your fabric is also unique. What you need is a team that can help you design a unique operating model.

- Only by knowing the status of each cloth you store can you truly control your inventory.

- This is why we will design a system to automatically collect the necessary data to determine the close relationship between the fabrics you store and the pallets and shelves you use.

- Warehouse areas and shelves can be drawn directly in EXCEL. The Bay-Row-Tier import system can automatically generate operable interactive web pages to accelerate the establishment of warehouse models. The storage areas, stocking areas and dock areas can all be incorporated into the visual storage system.

- UHF RFID is used to quickly collect and check the quantity and content of the goods, confirm that every link in the process of entering, leaving or moving the warehouse can be accurate and save considerable labor costs.

- In addition, the calculation of the intelligent distribution shelf helps you to allocate the shelves and select the time appropriately to improve the overall efficiency.

- The automatic camera function after scanning the pallet by auto-sensing allows you to use high-resolution images to view the fabrics on the shelf in the visualized warehouse system. You can even see the labels and directly visually count or select the most convenient fabric to take out, reducing storage and transportation. The number of times that personnel turn over positions.

- You can choose a team that is very professional in cloth management—Ledway Information.
