

## Shinkong Synthetic Fibers Corporation

**M**ore and more people are focusing on environmental protection and how to reduce carbon dioxide. So do us. We, Shinkong Synthetic Fibers Corporation, keep paying attention to such issues and thinking about what we can work for this world.

In the 2022 TITAS show, we will still focus on sustainable topics. Not only well-known recycled bottled yarn but also below.

### ◆Garment recycled yarn

Through the fast fashion trend, increasingly used clothes have become a big issue. In the past, used clothes would be disposed of or burned. However, now we have a new way to solve it. With special technology, Shinkong can reuse this waste now. Taking those garments back to the material stage and producing the polyester to achieve a sustainable cycle.

### ◆Biodegradable yarn

Generally, polyester products need centuries to be biodegraded after throwing. With the latest biodegradable techniques, it has become yummy for those existing bacteria. Then, polyester can be degraded faster than in the past.

### ◆Carbon Neutrality development

How to reduce carbon emissions now is already the homework for the whole world and all human beings. Shinkong is also trying its best to develop such products. Besides improving the production line, we keep checking any other way for us to achieve carbon neutrality. In the near future, we' ll show you.

“Sustainability” has been the mainstream. How to protect the environment is already everyone' s responsibility and obligation. Considering our next generation and the future of the earth, Shinkong will keep moving on for sure. Want to know more? See you soon in TITAS.
